ASTRONOMY

Shanku Yantram

आयुष्यशास्त्रेण शंखु यन्त्रेण विदितम् ।
 मन्त्रैश्चादित्योर्म पतितोर्म चैव शीघ्रोच्चत् ॥

(Aryabhatiya, Aryabhatiya, 17.189 CE)

The mean planets move on their orbits and the true planets in eccentric circles. All the planets whether moving on their orbits or in eccentric circles move with their own motion, anti-clockwise from their Apogees and clockwise from their Perigees.

[Aryabhatta stated this law in the 5th century AD, much before the first law of planetary motion was given by Johannes Kepler in 17th century CE.]

Break free from the orbit of the west !

Path of all Celestial Bodies

त्रिनाभिक्रम
 विश्वा भूवन

The elliptical path through which celestial bodies move is imperishable. This is called Trinabhikrama. It consists of three foci. The distance from the foci is constant. In the western tradition up to 1609, it was believed that the path of other Celestial bodies is elliptical.

Later Johannes Kepler proposed that the path of other Celestial bodies is elliptical.

superintendent of police Sri Abhishek Mohanty Gracing the Sanskrit Science Exhibition

Two men are walking through the exhibition booth. The man on the left is wearing a maroon vest over a white shirt and a sash with a circular emblem. The man on the right is wearing a blue shirt and black trousers. They are both looking towards the right side of the booth.
